

# OUR SIX STEP APPROACH TO TREATING YOUR PROSTATE CANCER

## STEP 1

### Send us your documents

All documents relevant to your prostate cancer (biopsy results, medical reports, blood test results etc.) are important for your initial assessment.

## STEP 2

### MRI SCAN

Once we have evaluated your documents, we will arrange an appointment for Magnetic Resonance Imaging (MRI) of your prostate at our Center.

This is an important step to fully detect the size and extend of your cancer and is the basis for planning your treatment.

## STEP 3

### Consultation

After we have all your documents and your MRI results, we will arrange a consultation with one of our Vitus physicians.

You will get to know your attending physician and you can learn about your disease and the procedure.

## STEP 4

### The day before NanoKnife Therapy

You will arrive at the clinic one day before the procedure. Depending on the time between Step 2 and Step 4, another MRI may be necessary.

Your attending physician and your anesthesiologist will walk you through the procedure and the informed consent form.

## STEP 5

### Your NanoKnife Therapy

On the day of your procedure, you will be fasting. The IRE procedure only takes approximately 2 hours.

After that, you will be closely monitored by our medical staff for another 90 to 120 minutes, and then overnight for your safety and convenience.

## STEP 6

### Final Check-up

The morning after your IRE procedure, you will undergo a control MRI. Afterwards you may leave the clinic and return to your normal daily life. The procedure is complete.

The catheter will remain for another 10 to 12 days and will then be removed by us or your urologist.
